Parameters

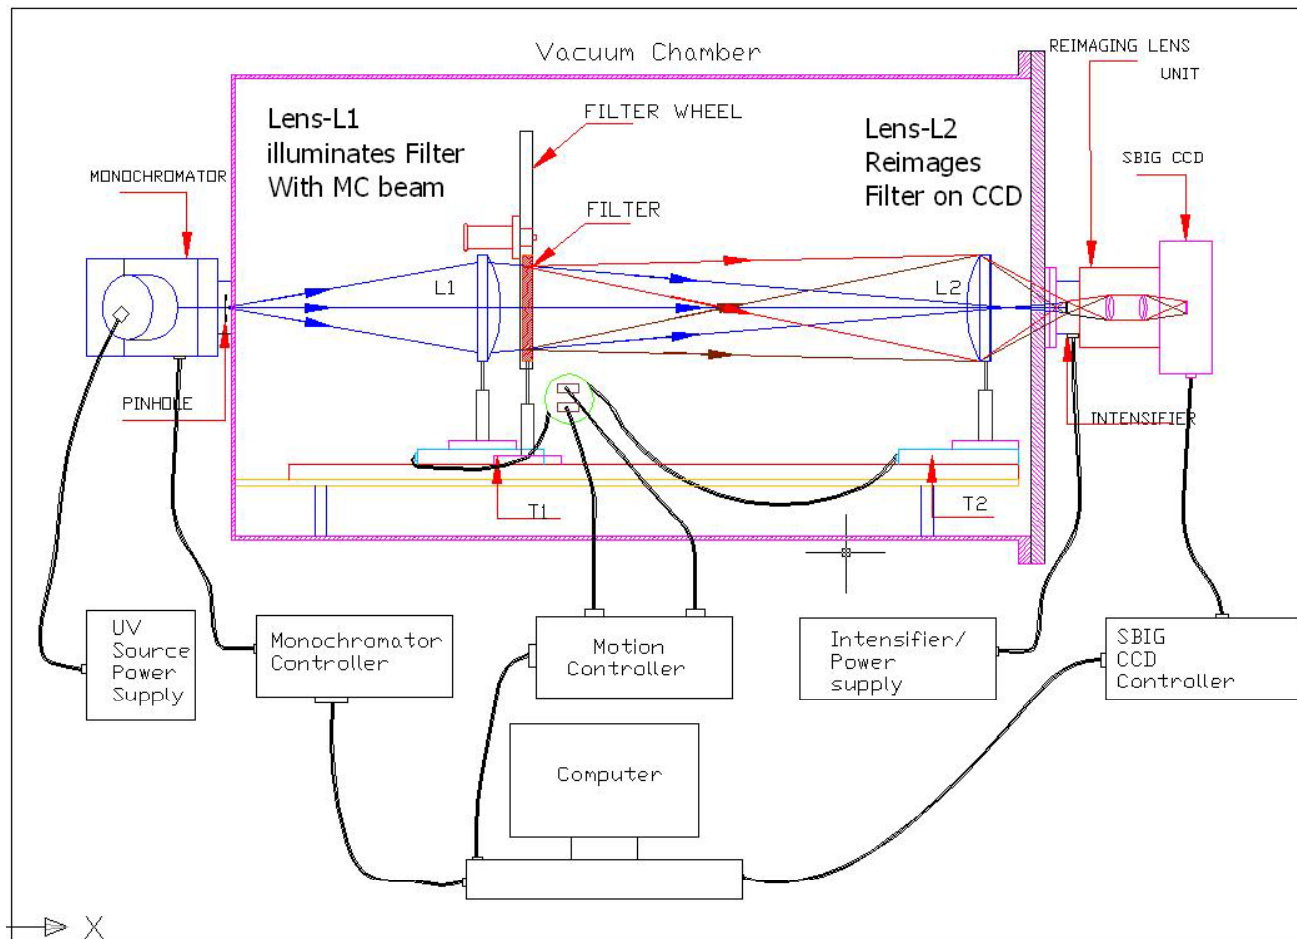

- Spatial Transmission
- Spectral Transmission
- Focus Shift
- Wedge Angle

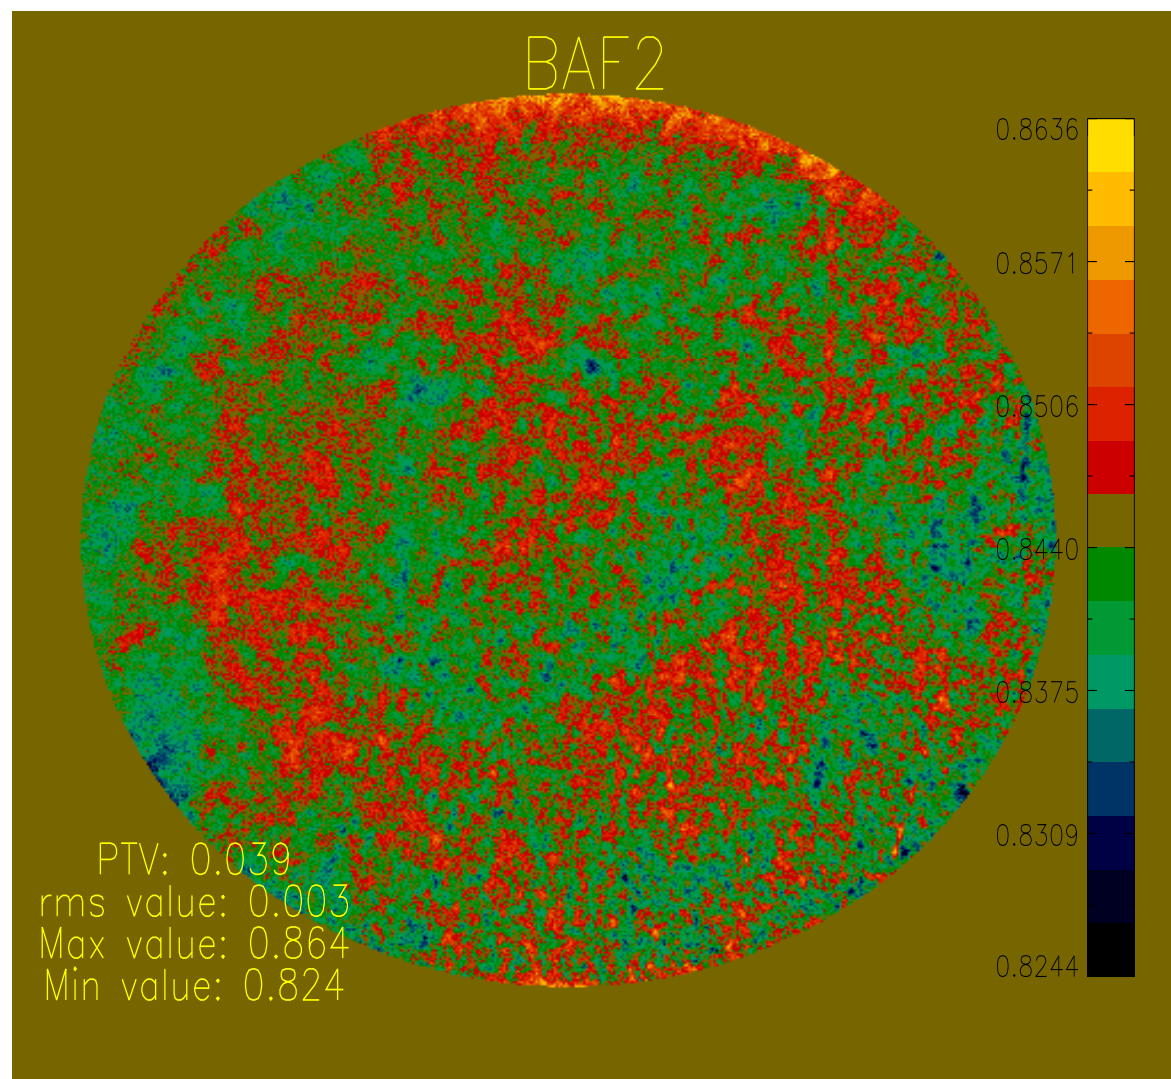

Focus Shift: Carried out with the Integrated System and hence will not be presented here.

Spatial Transmission Variation

Principle:

- Image of the filter illuminated by a monochromatic source
- Ratio of the image with and without filter provides the spatial non-uniformity in the filter
- Central wavelength of the filters is used to estimate the spatial variation
- Same experiment is used to estimate the spectral transmission

Wedge Angle

Principle:

- A pinhole is imaged with and without filter.
- Filter Wheel is placed in the collimated beam
- Shift in the pinhole image position with filter compared to without filter is estimated.
- This shift divided by the focal length of L2 is the wedge angle of the filter.
