

Nature of quasars without emission lines in SDSS and 2dF surveys

C. S. Stalin

Quasars

- Quasars come under two broad classes (radio-loud and radio-quiet)
- About 85% of quasars are radio-quiet
- Spectral energy distribution is the same (radio and hard X-ray)
- Flat Spectrum Quasars
- Steep Spectrum Quasars
- BL Lac objects

Qu

BL Lac objects and radio quiet quasars

- Radio loud
- X-ray loud
- Featureless optical spectrum
- High polarization
- Intra-night optical variability (large amplitude and large duty cycle)
- Radio quiet
- X-ray weak
- Optical spectrum has features
- Low polarization
- Intra-night optical variability (small amplitude and low duty cycle)

eccular sources in SDSS and 2dF surveys

- Featureless spectrum (similar to classical BL Lacs)
- Radio-quiet
- X-ray quiet
- Optically un-polarized

SDSS J153259.96-003944.1

First reported by Fan et al. 1999; $z = 4.52$

< 60 micro-Jy (1.4 GHz); $< 4\%$ optical polarization; weak
detection by Chandra

53 (2dF) & 383 (SDSS)

Possible explanations

- Are they Radio-quiet BL Lacs ?
- Are they radio-quiet quasars undergoing microlensing ?
- Are they radio-quiet quasars without a Broad Line Region

Observational Tests

- Intra-night optical variability observations
- Optical polarization
- Deep radio observations
- Deep X-ray observations

Observations

- Intra-night optical variability (Telescopes: 2m HCT and 1.2m OHP)
- 12 objects monitored in R-band on a total of 23 nights (13 nights on HCT & 10 nights on OHP)
- Polarization observations (Telescope: ESO 3.6m)
- 19 objects observed for Polarization

Results

- Low levels of variability (similar to radio-quiet quasars) seen in two objects
- All 19 objects have $< 2\%$ optical polarization (similar to radio-quiet quasars)

SDSS J1048+620

02-Dec-05 (xxx hr)

SDSS J0901+032

01-Dec-05 (xx hr)

SDSS J2247+137

05-Oct-05 (xx hr)

SDSS J2324+147

01-Dec-05 (xxx hr)

Conclusions

- This optical sample is not the yet unrecognized radio-quiet BL Lac population
- Could belong to a new population of radio-quiet quasars without a Broad Line Region ??
- Could some be BL Lac objects at $z > 1$ (but with properties different from their low redshift counterparts) ???
